

Legal Document Intelligence Blueprint

A practical enterprise decision guide from DigiScience Techsol

ASSET TYPE: SOURCE-TO-REVIEW WORKSHEET

Illustrative planning method | Updated 20 September 2026

Plan one document family and review workflow. This blueprint describes evidence handling; it is not legal advice, a legal interpretation or a customer result. The buyer's authorized legal reviewer remains responsible for decisions.

Establish the source set

Identify the document family, approved templates, clause playbook, obligation categories, metadata and controlled guidance. Ask the reviewer to label a representative sample, including amendments, poor scans and absent clauses. Agree what counts as a correct extraction before evaluating it.

Source-to-review record

- Document and revision: record document ID, version and related amendments. The reviewer identifies the applicable source set.
- Source evidence: retain the page or section and extracted passage so the reviewer can locate and compare it.
- Candidate obligation: capture the action, responsible party and relevant condition. Mark accept, correct or reject after review.
- Date components: record the trigger, stated period and required reference date. Missing components remain unresolved.
- Uncertainty and disposition: record conflicts, missing evidence, reviewer and decision. Assign an owner and next action before reliance.

Proposed information flow

Document repository -> secure ingestion and OCR -> classification and extraction -> retrieval and comparison -> legal review queue -> approval -> source traceability and audit. Keep access control and source traceability throughout the flow. Extraction proposes a candidate; it does not decide legal effect. Missing dates, conflicting amendments and ambiguous parties enter review rather than becoming accepted obligations automatically.

Worked fictional example

An invented contract says notice is required 30 days before renewal. The extracted record lacks a confirmed renewal date, and another uploaded document appears to amend the notice provision. Retain both references and mark the date and applicable wording unresolved for the authorized reviewer. Do not choose today's date, assume the newest filename controls, or issue a notice automatically. This is a review-design example, not an interpretation of a real agreement.

Evaluate extraction separately

Precision is correct extracted items divided by all extracted items. Recall is correct extracted items divided by all reference items. Define item matching consistently. Report missing fields, wrong source references and unresolved cases alongside these measures. A confidence score can help route review; it does not prove legal correctness. Select thresholds using the task's evidence and consequences. This worksheet sets no universal pass score. Also review source-link accuracy, reviewer acceptance and audit completeness.

Bounded next step and source

A Solution Assessment can examine one document-review problem and recommend a workflow and implementation brief. It excludes legal advice, coding, a working proof of concept and production integration. Do not send confidential contracts through the public form.
