

Cloud + AI Cost Governance Snapshot

DigiScience Techsol | Planning brief | 21 September 2026

Start with one defined cost question. Separate higher demand from a higher cost per useful result before changing resources. This brief describes an assessment approach, not measured savings or completed customer work.

Build a comparable baseline

Use the same billing scope, currency and period length. Separate credits, taxes and one-off charges. Group spending by workload, environment and owner; document how shared services are allocated. Match usage to accepted business outcomes and retain failed or retried requests as visible costs.

Check the whole workflow

Review idle capacity, storage growth, data transfer, logging and model usage where relevant. AI workflows may also incur retrieval, embeddings, indexing and human-review costs. Confirm a resource's purpose before proposing removal. Budget alerts are not automatically spending caps.

Work one transparent example

Fictional example: INR 12,000 allocated workflow cost divided by 3,000 accepted results equals INR 4 per accepted result. Include failed attempts in the agreed cost boundary. Define acceptance first, then compare quality, latency, rejection rate and workload mix alongside cost. These numbers are invented arithmetic, not provider prices or a savings claim.

Make the next decision explicit

Record the cost question, workload owner, billing period, activity count, largest unexplained driver and operational constraints. Decide whether the next step is clearer ownership, a usage policy or a separately tested technical change. For any implementation, define the owner, quality checks, comparison period and rollback condition first.

Use the current assessment route

The DigiScience Solution Assessment covers one defined problem and provides a problem brief, options assessment, recommended path and implementation brief. It does not include coding, a working proof of concept, production implementation or ongoing cost operations. Review current scope, prices, payment terms and turnaround at <https://digiscience.techsol.com/solution-assessment> before agreeing an engagement.

Bring a redacted billing summary, workload diagram and activity count. Do not send credentials, sensitive prompts or financial documents through a public form.
